

FEATURES

- 10 years minimum data retention in the absence of external power
- Data is automatically protected during power loss
- Replaces 512k x 8 volatile static RAM, EEPROM or Flash memory
- Unlimited write cycles
- Low-power CMOS
- Read and write access times as fast as 100ns
- Lithium energy source is electrically disconnected to retain freshness until power is applied for the first time
- Optional industrial temperature range of 40 to +85 , designated IND
- JEDEC standard 32-pin DIP package
- PowerCap ® Module (PCM) package
 - Directly surface-mountable module
 - Replaceable snap-on PowerCap Provides lithium backup battery
 - Standardized pinout for all nonvolatile SRAM products
 - Detachment feature on PCM allows easy removal using a regular screwdriver

DESCRIPTION

The DS1250W 3.3V 4096k Nonvolatile SRAM is a 4,194,304-bit, fully static, nonvolatile SRAM organized as 524288 words by 8 bits. Each NV SRAM has a self-contained lithium energy source and control circuitry, which constantly monitors Vcc for an out-of-tolerance condition. When such a condition occurs, the lithium energy source is automatically switched on and write protection is unconditionally enabled to prevent data corruption. DIP-package DS1250W devices can be used in place of existing 512k x 8 static RAMs directly conforming to the popular byte-wide 32-pin DIP standard. DS1250W devices in the PowerCap to form a complete Nonvolatile SRAM module. There is no limit on the number of write cycles that can be executed and no additional support circuitry is required for microprocessor interfacing.

READ MODE

The DS1250W executes a read cycle whenever \overline{WE} (Write Enable) is inactive (high) and \overline{CE} (Chip Enable) and \overline{OE} (Output Enable) are active (low). The unique address specified by the 19 address inputs (A0-A18) defines which of the 524,288 bytes of data is to be accessed. Valid data will be available to the eight data output drivers within t_{ACC} (Access Time) after the last address input signal is stable, providing that \overline{CE} and \overline{OE} (Output Enable) access times are also satisfied. If \overline{OE} and \overline{CE} access times are not satisfied, then data access must be measured from the later-occurring signal (\overline{CE} or \overline{OE}) and the limiting parameter is either t_{CO} for \overline{CE} or t_{OE} for \overline{OE} rather than address access.

WRITE MODE

The DS1250W executes a write cycle whenever the \overline{WE} and \overline{CE} signals are active (low) after address inputs are stable. The later-occurring falling edge of \overline{CE} or \overline{WE} will determine the start of the write cycle. The write cycle is terminated by the earlier rising edge of \overline{CE} or \overline{WE} . All address inputs must be kept valid throughout the write cycle. \overline{WE} must return to the high state for a minimum recovery time (t_{WR}) before another cycle can be initiated. The \overline{OE} control signal should be kept inactive (high) during write cycles to avoid bus contention. However, if the output drivers are enabled (\overline{CE} and \overline{OE} active) then \overline{WE} will disable the outputs in t_{ODW} from its falling edge.

DATA RETENTION MODE

The DS1250W provides full functional capability for Vcc greater than 3.0 volts and write protects by 2.8 volts. Data is maintained in the absence of Vcc without any additional support circuitry. The nonvolatile static RAMs constantly monitor Vcc. Should the supply voltage decay, the NV SRAMs automatically write protect themselves, all inputs become “don’t care,” and all outputs become high-impedance. As Vcc falls below approximately 2.5 volts, a power switching circuit connects the lithium energy source to RAM to retain data. During power-up, when Vcc rises above approximately 2.5 volts, the power switching circuit connects external Vcc to RAM and disconnects the lithium energy source. Normal RAM operation can resume after Vcc exceeds 3.0 volts.

FRESHNESS SEAL

Each DS1250W device is shipped from ARTSCHIP Semiconductor with its lithium energy source disconnected, guaranteeing full energy capacity. When Vcc is first applied at a level greater than 3.0 volts, the lithium energy source is enabled for battery back-up operation.

PACKAGES

The DS1250W is available in two packages: 32-pin DIP and 34-pin PowerCap Module (PCM). The 32-pin DIP integrates a lithium battery, an SRAM memory and a nonvolatile control function into a single package with a JEDEC-standard 600-mil DIP pinout. The 34-pin PowerCap Module integrates SRAM memory and nonvolatile control into a module base along with contacts for connection to the lithium battery in the DS9034PC PowerCap. The PowerCap Module package design allows a DS1250W PCM device to be surface mounted without subjecting its lithium backup battery to destructive high-temperature reflow soldering. After a DS1250W module base is reflow soldered, a DS9034PC PowerCap is snapped on top of the base to form a complete Nonvolatile SRAM module. The DS9034PC is keyed to prevent improper attachment. DS1250W module bases and DS9034PC PowerCaps are ordered separately and shipped in separate containers. See the DS9034PC data sheet for further information.

ABSOLUTE MAXIMUM RATINGS *

| | |
|---------------------------------------|---------------------------------------|
| Voltage on Any Pin Relative to Ground | -0.3V to +4.6V |
| Operating Temperature | 0 to 70 , -40 to +85 for IND parts |
| Storage Temperature | -40 to +70 , -40 to +85 for IND parts |
| Soldering Temperature | 260 for 10 seconds |

*This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

RECOMMENDED DC OPERATING CONDITIONS

(t_A : See Note 10)

| PARAMETER | SYMBOL | MIN | TYP | MAX | UNITS | NOTES |

| Expected Data Retention Time | t_{DR} | 10 | | | years | 9 |

WARNING

Under no circumstance are negative undershoots, of any amplitude, allowed when device is in battery backup mode.

NOTES:

1. \overline{WE} is high for a Read Cycle.
2. $\overline{OE}=V_{IH}$ or V_{IL} . If $\overline{OE}=V_{IH}$ during write cycle, the output buffers remain in a high-impedance state.
3. t_{WP} is specified as the logical AND of \overline{CE} and \overline{WE} . t_{WP} is measured from the latter of \overline{CE} and \overline{WE} going low to the earlier of \overline{CE} or \overline{WE} going high.
4. t_{DH} , t_{DS} are measured from the earlier of \overline{CE} or \overline{WE} going high.
5. These parameters are sampled with a 5pF load and are not 100% tested.
6. if the \overline{CE} low transition occurs simultaneously with or latter than the \overline{WE} low transition, the output buffers remain in a high-impedance state during this period.
7. if the \overline{CE} high transition occurs prior to or simultaneously with the \overline{WE} high transition, the output buffers remain in high-impedance state during this period.
8. If \overline{WE} is low or the \overline{WE} low transition occurs prior to or simultaneously with the \overline{CE} low transition, the output buffers remain in a high-impedance state during this period.

9. Each DS1250W has a built-in switch that disconnects the lithium source until Vcc is first applied by the user. The expected t_{DR} is defined as accumulative time in the absence of Vcc starting from the time power is first applied by the user.
10. All AC and DC electrical characteristics are valid over the full operating temperature range. For commercial products, this range is 0 to 70 . For industrial products (IND), this range is -40 to +85 .
11. In a power-down condition the voltage on any pin may not exceed the voltage on Vcc.
12. t_{WR1} and t_{DH1} are measured from \overline{WE} going high.
13. t_{WR1} and t_{DH1} are measured from \overline{CE} going high.
14. DS1250 modules are recognized by Underwriters Laboratory (U.L.®) under file E99151.

DC TEST CONDITIONS

Outputs Open

Cycle=200ns for operating current

All voltages are referenced to ground

AC TEST CONDITIONS

Output Load: 100pF +1TTL Gate

Input Pulse Levels: 0 to 2.7V

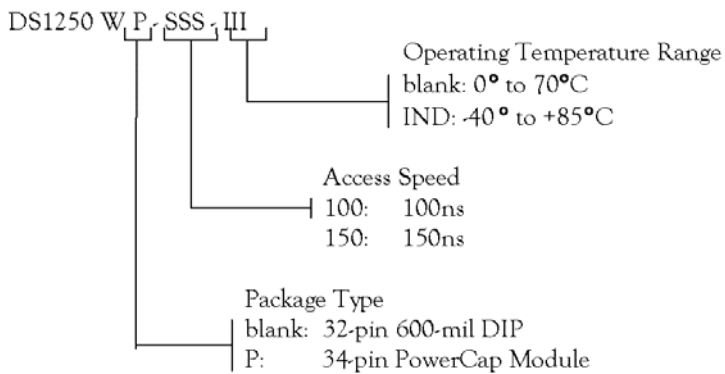

Timing Measurement Reference Levels

Input: 1.5V

Output: 1.5V

Input pulse Rise and Fall Times: 5ns

ASSEMBLY AND USE

Reflow soldering

ARTSCHIP Semiconductor recommends that PowerCap Module bases experience one pass through solder reflow oriented label-side up (live-bug).

Hand soldering and touch-up

Do not touch soldering iron to leads for more than 3 seconds. To solder, apply flux to the pad, heat the lead frame pad and apply solder. To remove part, apply flux, heat pad until solder reflows, and use a solder wick.

LPM replacement in a socket

To replace a Low Profile Module in a 68-pin PLCC socket, attach a DS9034PC PowerCap to module base then insert the complete module into the socket one row of leads at a time, pushing only on the corners of the cap. Never apply force to the center of the device. To remove from a socket, use a PLCC extraction tool and ensure that it does not hit or damage any of the module IC components. Do not use any other tool for extraction.
